## File path traversal, simple case

---

1. This lab contains a path traversal vulnerability in the display of product images.

2. I opened a product image in new tab and the URL becomes:

```
https://0a91007904daf8d78101bb9f008300ea.web-security-  
academy.net/image?filename=44.jpg
```

3. I tried to inject my payload into filename parameter like this:

```
https://0a91007904daf8d78101bb9f008300ea.web-security-  
academy.net/image?filename=/etc/passwd
```

but the response is “No such file”.

4. I tried to traverse in file system using ‘../’ till I found different response retrieved when I inject this payload :

```
../../../../etc/passwd
```

5. And here we go, the lab solved.

File path traversal, simple case
