
SQL injection UNION attack, retrieving data from other tables

1. This lab contains a SQL injection vulnerability in the product category filter.
2. The idea of this lab is so easy. I need to retrieve username and password of admin user from users' table.
3. First, I injected the basic payload to know how many columns returned and I found two columns returned.
4. Then I hit the payload:
`Category=Pets' UNION SELECT username, password FROM users—`
The admin username: **administrator**
The admin password: **ahm4ad63gsv594yfs9o**

5. Logged in successfully.

SQL injection UNION attack, retrieving data from other tables
